

Functions, Domain and Range Overview

The test for a function (from a graph)

A *relation* is any set of ordered pairs (x,y). A *function* is a special type of relation. A **function** is a relation where each x-value has only one y-value. The **vertical line test** can be used to determine if the graph of a relation is a function. If a vertical line passes through more than one point anywhere on the graph, then it is not a function. See the examples below:

NOT a function: fails vertical line test

NOT a function: fails vertical line test

IS a function: passes vertical line test

IS a function: passes vertical line test

The test for a function from its equation

1. A *relation* is **NOT A FUNCTION** if there exists:

- (i) a " \pm " symbol on an x-expression or
- (ii) even power of y or
- (iii) y-variable expression inside absolute value symbols or
- (iv) inequality symbols ($<$, $>$, \leq , \geq)

Examples of how each of these 4 cases fail the vertical line test

(i) $y = \pm\sqrt{x+2}$
(ii)

$x = y^2$ (iii) $x = |y|$

(iv)

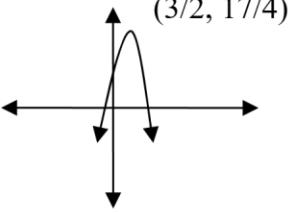

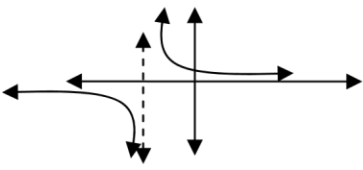

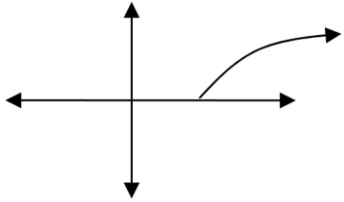

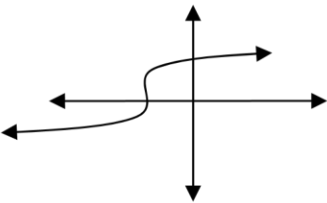

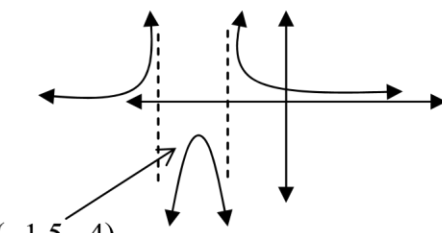

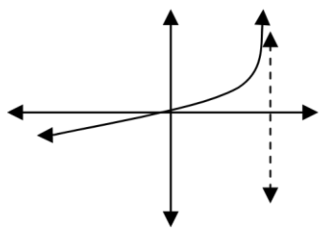

$y \geq x$

2. In ALL other cases the relation IS A FUNCTION.

Determining the domain of a function from its equation

Domain deals with the acceptable values for the x variable and Range deals with the subsequent values for the y variable. Below are some examples that show some of the various types of problems most students encounter. Mainly two things limit your domain, a fraction and an even indexed radical. The range is probably easiest to determine when looking at a graph of the function.

<p>1. $y = -x^2 + 3x + 2$</p>  <p>(3/2, 17/4)</p> <div style="border: 1px solid black; padding: 5px; width: fit-content; margin: 10px auto;"> <p>Hint: find highest or lowest point for range</p> </div> <p>Domain: no limits : $(-\infty, +\infty)$ Range: The y values have a peak but no bottom so the range is $(-\infty, 17/4]$</p>	<p>2. $y = \frac{1}{x+2}$</p>  <div style="border: 1px solid black; padding: 5px; width: fit-content; margin: 10px auto;"> <p>Hint: denominator can not equal 0; thus we set the bottom equal to 0; solve for x.</p> </div> <div style="border: 1px solid black; padding: 5px; width: fit-content; margin: 10px auto;"> $x + 2 = 0$ $x = -2$ </div> <p>Domain: $(-\infty, -2) \cup (-2, +\infty)$ Range: $(-\infty, 0) \cup (0, +\infty)$</p>
<p>3. $y = \sqrt[4]{x-4}$</p>  <div style="border: 1px solid black; padding: 5px; width: fit-content; margin: 10px auto;"> <p>Hint: Even indexed roots have to be ≥ 0 if not in the denominator</p> </div> <div style="border: 1px solid black; padding: 5px; width: fit-content; margin: 10px auto;"> <p>Set the inside $x - 4 \geq 0$ and solve for x, thus $x \geq 4$</p> </div> <p>Domain: $[4, +\infty)$ Range: since y never gets less than 0, $[0, +\infty)$</p>	<p>4. $y = \sqrt[3]{x+3}$</p>  <div style="border: 1px solid black; padding: 5px; width: fit-content; margin: 10px auto;"> <p>Hint: no values of x will give undefined values, nor are any values of y not used. * this will hold true for any odd index.</p> </div> <p>Domain: $(-\infty, +\infty)$ Range: $(-\infty, +\infty)$</p>
<p>5. $y = \frac{1}{x^2 + 3x + 2}$</p>  <p>(-1.5, -4)</p> <div style="border: 1px solid black; padding: 5px; width: fit-content; margin: 10px auto;"> <p>Hint: set the bottom = 0 and solve by factoring.</p> </div> <div style="border: 1px solid black; padding: 5px; width: fit-content; margin: 10px auto;"> $x^2 + 3x + 2 = 0,$ $x + 1 = 0,$ $x = -1 \text{ and}$ $x + 2 = 0$ $x = -2$ <p>avoid $x = -1$ & -2</p> </div> <p>Domain: $(-\infty, -2) \cup (-2, -1) \cup (-1, +\infty)$ Range: $(-\infty, -4] \cup (0, +\infty)$</p>	<p>6. $y = \frac{3x}{\sqrt{4-x}}$</p>  <div style="border: 1px solid black; padding: 5px; width: fit-content; margin: 10px auto;"> <p>Hint: *compare to #3 & #2.</p> </div> <div style="border: 1px solid black; padding: 5px; width: fit-content; margin: 10px auto;"> <p>set inside of radical > 0 and solve for x; *not = 0 since in the denominator. $4 - x > 0;$ thus $4 > x$ or $x < 4$</p> </div> <p>Domain: $(-\infty, 4)$ (remember : $x \neq 4$) Range: $(-\infty, +\infty)$</p>
